KB Restructure — PM Review How-To

Your deadline to finish your review: ~November 13, 2026 Restructured KB goes live: November 30, 2026

Thanks for helping with the Knowledge Base restructure. This guide walks you through reviewing the changes in your product area. The whole process is driven by a Claude skill, so you don't need to hunt through files or know any git — you'll mostly answer questions.

What you're being asked to do

As part of the restructure, Claude generated new navigation articles (overviews, "What is X" pages) and gap-fill articles, and made edits to some existing articles in your area. All of it has been drafted and fact-checked by AI, but it needs a human expert — you — to confirm it's **accurate** and **phrased the way you'd want**.

For each item, you'll do one of the following:

- **Approve** — it's correct as written.
- **Change / rewrite** — tell Claude what to fix; it edits, shows you, and you confirm.
- **Reject** — back the change out entirely.
- **Answer** — some articles have an open question marked for you (`[pm-input]`); you provide the missing information so the article can be finished or written.

That's the whole job: go down your checklist and give each item one of those responses.

A special case: articles that still need to be written

Part of your checklist may be **gap-fill articles** — pages the restructure identified as missing in your area but that couldn't be written without your input. These don't exist yet, so instead of reviewing a change, you'll decide what should happen to each one. You have three choices, and Claude will record whichever you pick:

- **Write it now** — the article is needed and you'll help. Claude interviews you for the details, drafts it, and you review it like any other item.
- **Defer it** — the article is still worth having, but not something you can get to this cycle. It's set aside and carried onto a follow-up list so it isn't lost; it just won't be written as part of this

restructure.

- **Drop it** — the article isn't actually needed (already covered elsewhere, no longer relevant, or not a real gap). It's removed from the restructure's scope for good. Unlike a deferral, a dropped article is **not** carried onto the follow-up list — so only drop when you're sure it shouldn't be written at all. Claude will ask you to confirm, and to say briefly why, before recording it.

If you're unsure whether something belongs in your area or should exist at all, defer it and flag it for Jared rather than dropping it.

One-time check: make sure you're on your branch

You have your own branch so your changes never collide with anyone else's. Open the `domo-documentation-hub` repo in VS Code with the Claude extension, then confirm you're on your branch. You can just ask Claude:

> What branch am I on?

It should be **`restructure/pm/<your-name>`** (for example, `restructure/pm/jordan-jensen`). If it isn't, ask Claude to switch you to it. If the branch doesn't exist, let Jared know — branches are created centrally.

Step 1 — Pull the latest

Before you start (and any time you come back to it), get the newest version of your branch. Just tell Claude:

> Pull the latest for my branch.

Step 2 — Start the review

In Claude, run the review skill:

```
/pm-review
```

It automatically loads **your** checklist based on the branch you're on. It'll tell you how much there is to review and pick up wherever you left off, so you can do it in one sitting or a little at a time.

Step 3 — Walk the checklist

Claude presents one item at a time. For each one it shows you the exact change (or the question it needs answered) and asks how you'd like to respond. Reply in plain language — **approve**, **change it** (and say how), **reject**, or **answer the question**. If you want to come back to something later, say **skip** and it'll resurface at the end.

A few tips:

- If you're not sure about a claim, you can hand Claude context to check it against — a spec, a CSV, a doc, screenshots, or notes. Just point it at them.
- Want to focus? Ask it to show you only a certain kind of item (for example, "just the fact-checks today").
- Ask "where are we?" any time for a count of what's done and what's left.

Step 4 — Commit and push when you're done (or at a stopping point)

When you finish — or just want to save progress — tell Claude:

> Commit and push my changes.

You do not need to create a pull request. Your branch already has a PR open that feeds back into the restructure. Committing and pushing is all that's needed; Jared merges the branches together at the end.

See your changes in a live preview

Because a PR already exists for your branch, there's a self-updating preview of the full restructured KB **with your changes included**. If you'd rather see the pages rendered than read diffs, ask Jared for your preview link — it refreshes automatically each time you push.

When you're finished

Once you've given every item a response and pushed, you're done — let Jared know so he can roll your branch into the restructure. Please aim to wrap up by **~November 13** so everything lands in time for the **November 30** go-live.

Questions or stuck? Reach out to Jared Peterson (Knowledge Base Administrator) — happy to give you a quick refresher or jump on a screen share to get you started.
